**Massage carriage****Abstract**

10 A massage carriage comprises a drive (1) that contains at least one motor and gearing parts, a first shaft (6) that can be moved by the drive (1) and a second shaft (7) that can be moved by the drive (1), two first arms, which are connected to the first shaft (6), can be moved by the first shaft (6) and on  
15 each of which a massage element is mounted, and two second arms, which are connected to the second shaft (7) and can be moved by the second shaft (7), one of which each acts on one of the first arms. In order to design the drive to be as compact, particularly as flat, as possible, it displays a single motor  
20 (2) with a motor shaft (3), by means of which the first and second shafts (6, 7) can each be moved via a reduction gear (4, 5). (Figure 1)
